Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 154 background values. Annual per-constituent alpha = 0.0008346. Individual comparison alpha = 0.00008349 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

Constituent: Calcium Analysis Run 3/28/2024 12:21 PM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Exceeds Limit: GWC-53

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 153 background values. Annual per-constituent alpha = 0.0008462. Individual comparison alpha = 0.00008465 (1 of 2). Comparing 2 points to limit. Assumes 3 future values.

Constituent: Chloride Analysis Run 3/28/2024 12:21 PM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limits

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 184 background values. Annual per-constituent alpha = 0.001167. Individual comparison alpha = 0.0001167 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

Constituent: pH Analysis Run 3/28/2024 12:21 PM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 154 background values. 38.96% NDs. Annual per-constituent alpha = 0.0008346. Individual comparison alpha = 0.00008349 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

GROUNDWATER STATS CONSULTING

January 31, 2025

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Scherer Cell 1 Landfill
Statistical Analysis – August 2024

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the groundwater statistical analysis for the 2024 2nd Semi-Annual Groundwater Monitoring Statistical Analysis sample event for Georgia Power Company's Plant Scherer Cell 1 Landfill. The analysis complies with the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the Coal Combustion Residuals (CCR) program in 2016. Semi-annual sampling for 16 parameters began in 2010 in accordance with the Georgia Department of Natural Resources, Environmental Protection Division (Georgia EPD) groundwater monitoring regulations. At least 8 background samples have been collected at each of the groundwater monitoring wells.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-15, GWA-16, and GWA-17
- **Downgradient wells:** GWC-1, GWC-2, GWC-3, GWC-4, GWC-5, GWC-6, GWC-7, GWC-8A, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14, GWC-18, GWC-19, and GWC-20

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager for Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The State and CCR program consist of the constituents listed below. The terms "parameters" and "constituents" are used interchangeably:

- **CCR Appendix III** - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I** - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Statistical analyses are not required when 100% non-detects are present in wells for a given constituent. A list of Appendix I and III well/constituent pairs with 100% non-detects follows this letter. Due to varying detection limits in data sets, generally due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given constituent; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. In the case of fluoride, varying reporting limits resulted for the August 2024 event; however, the most recent reporting limit of 0.1 mg/L was substituted across all wells to maintain statistical limits that are conservative from a regulatory perspective.

Time series plots for CCR Appendix III and Georgia EPD Appendix I parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended.

Power curves were provided with the background update described below to demonstrate that the selected statistical methods for the constituents listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. It is assumed a minimum of 14 background samples for the state parameters and a minimum of 11 background samples for the federal parameters are available to provide adequate statistical power using a 1-of-2 resample plan. For any well/constituent pairs that contain less than the minimum sample size requirements, the earlier portion of the record required truncation due to elevated concentrations compared to recently reported measurements which results in more conservative (i.e., lower) limits. Power curves were based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Interwell Prediction Limits with 1-of-2 resample plan (arsenic and silver)
- Intrawell Prediction Limits with 1-of-2 resample plan (antimony, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc)
- # Constituents: 16
- # Downgradient wells: 17

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (boron, calcium, chloride, fluoride, pH, sulfate, and TDS)
- # Constituents: 7
- # Downgradient wells: 17

The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification

resample plan. The following approaches are used for handling non-detects (USEPA, 2009):

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points is available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts to groundwater quality in downgradient wells. Intrawell methods use background data from individual wells and may be overly sensitive to spatial variation. In particular, for nonparametric limits with small background sample sizes, the probability of a false positive result is higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of spatial variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSIs) that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical

evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United States Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed SSI.

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an apparent intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial variation rather than a result of impact to groundwater quality downgradient of the facility.

Summary of Background Screening – CCR Appendix III – Conducted in 2017

The original background screening for CCR Appendix III constituents was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database

and excluded prior to construction of statistical limits. Intrawell prediction limits, combined with a 1-of-2 resample plan, were recommended. The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter. Based on the results of the original background screening, intrawell tests were recommended for all Appendix III parameters.

Summary of Background Screening – Georgia EPD Appendix I – Conducted in August 2019

Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of Tukey's outlier test as well as a discussion of potential outliers and flagged values were included with the background screening report.

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trend Tests

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all

upgradient wells and downgradient wells with detections for the following constituents: arsenic, barium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses showed several statistically significant increasing trends. However, the majority of these trends were relatively low in magnitude when compared to average concentrations; therefore, most records required no adjustments. The following well/constituent pairs did require adjustments to the records in order to remove increasing trends and use more recent data that will result in statistical limits representative of present-day groundwater quality conditions: chromium in wells GWC-1 and GWC-10, and vanadium in well GWC-1. A summary of the background periods used for these well/constituent pairs follows this letter. When an increasing trend in a downgradient well is removed by truncating the earlier portion of the record for a constituent analyzed by intrawell limits, it is assumed that the trend is not the result of the facility. This assumption is supported by a boxplot for all wells, by pre-waste data, or by an alternate source demonstration.

Selenium at well GWC-5 had elevated concentrations beginning in 2015, reportedly, due to surface infiltration from a leaking pipe that has since been fixed. Therefore, trend tests were recommended in lieu of prediction limits. While the trend test showed an increasing trend when the entire record of data was evaluated, an additional trend test which evaluated only the most recent 8 measurements was included and demonstrated that the more recent measurements result in a statistically significant decreasing trend. Prediction limits resumed when at least 8 measurements returned to background levels.

Several statistically significant decreasing trends were noted, but no records required adjustment during the screening. Vanadium at well GWC-8A has several more recent low-level reported concentrations similar to those reported during the earliest years of sampling. If these low-level concentrations continue, once a minimum of 8 new observations is available, the background data will likely be truncated to only use more recent data for construction of statistical limits.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells which included: arsenic, barium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc. The ANOVA assists in identifying the most appropriate statistical approach. Based on the results of the background screening, intrawell tests were recommended for antimony, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc, while interwell tests were recommended for arsenic and silver. A summary table of the ANOVA results and a discussion of the intrawell method eligibility was included with the screening.

Background Updates – Georgia EPD Appendix I and CCR Appendix III

June 2021

Outlier Analysis

Prior to updating background data, visual screening was used to evaluate data for suspected outliers in upgradient and downgradient wells through September 2020. All of the more recent compliance measurements appeared stable with no spurious measurements compared to the previously screened historical data sets; therefore, no new outliers were flagged except for a high value for sulfate at well GWC-13 and the historic highest values for chloride and sulfate at GWC-5. These values were flagged in order to maintain conservative (i.e., lower) statistical limits. Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents tested using intrawell prediction limits, which includes all Georgia EPD Appendix I constituents (except arsenic and silver which utilize interwell prediction limits) and all CCR Appendix III constituents, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through October 2018 to the new compliance samples at each well through September 2020. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not performed. A list of well/constituent pairs with no variation was submitted with the background update. When the medians of the two groups are not statistically significantly different at the 99% confidence level, background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding

updating background records were included with the background update report. A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods will be re-evaluated during each background update.

Trend Tests

For constituents requiring interwell prediction limits (arsenic and silver), the Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells. As mentioned above, in the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend, thus reducing variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. No significant trends were identified among upgradient wells for arsenic and silver; therefore, no further action was necessary. Complete graphical results of the trend tests were submitted with the background update report.

May 2023

Outlier Analysis

Prior to updating background data, visual screening and Tukey's outlier test were used to evaluate data for suspected outliers in upgradient and downgradient wells through December 2022. Both Tukey's outlier test and visual screening confirmed previously flagged outliers with the exception of low values for pH at upgradient well GWA-15, downgradient wells GWC-2, GWC-11, GWC-12, and GWC-14. These values were unflagged during the update as the measurements were representative of concentrations throughout the respective records. Elevated historic concentrations compared to present-day conditions, such as the highest respective values for copper in downgradient well GWC-8A, lead in downgradient well GWC-3, pH in well GWC-2, and TDS in downgradient well GWC-11, were flagged in order to maintain conservative (i.e., lower) statistical limits. A summary of all flagged outliers follows this letter (Figure C). Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents tested using intrawell prediction limits, which include all Georgia EPD Appendix I constituents (except arsenic and silver which utilize interwell prediction limits) and all CCR Appendix III constituents, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through September 2020 to the new compliance samples at each well through December 2022. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not performed. When the medians of the two groups are not statistically significantly different at the 99% confidence level (either an increase or decrease), background data sets may be updated to include the newer compliance data. The results of the Mann-Whitney test showed statistically significant differences for the following well/constituent pairs:

Increase:

- Barium: GWC-10, GWC-12, GWC-13, GWC-19, and GWC-4
- Calcium: GWC-19, GWC-4, and GWC-8A
- Chloride: GWA-15 (upgradient) GWC-10, GWC-14, GWC-18, GWC-19, GWC-7
- Chromium: GWC-10 and GWC-19
- Nickel: GWC-2 and GWC-8A
- pH: GWC-18
- Sulfate: GWC-10 and GWC-4

Decrease:

- Antimony: GWC-4
- Beryllium: GWC-5 and GWC-8A
- Boron: GWC-5 and GWC-6
- Cadmium: GWC-2
- Calcium: GWC-5
- Cobalt: GWC-12 and GWC-9
- Copper: GWC-1, GWC-2, and GWC-3
- Fluoride: GWC-18 and GWC-19
- Nickel: GWA-15 (upgradient), GWC-1, GWC-11, GWC-12, GWC-20, GWC-4, GWC-5, and GWC-6
- Selenium: GWC-4 and GWC-5
- Sulfate: GWC-5
- Thallium: GWC-19, GWC-5, GWC-6, GWC-8A, and GWC-9
- TDS: GWC-5
- Vanadium: GWA-8A (upgradient)

For both Appendix I and III well/constituent pairs with a statistically significant increase in median concentrations, the following records were not updated with data through December 2022 in order to maintain statistical limits that are conservative from a regulatory perspective:

- Barium: GWC-10, GWC-13, GWC-19, and GWC-4
- Calcium: GWC-19 and GWC-8A
- Sulfate: GWC-10 and GWC-4

The following records were updated through December 2022 because the newer data were within or close to the range of earlier data and would have little to no impact on resulting statistical limits:

- Barium: GWC-12
- Calcium: GWC-4
- Chloride: GWA-15 (upgradient), GWC-10, GWC-14, GWC-18, GWC-19, GWC-7
- Chromium: GWC-10 and GWC-19
- Nickel: GWC-2 and GWC-8A
- pH: GWC-18

Note that the record for calcium at GWC-4 was updated through August 2022 rather than December 2022 in order to maintain statistical limits that are conservative (i.e., lower) from a regulatory perspective. Although an increasing trend is present for chloride at well GWC-10, the reported concentrations remain low resulting in an intrawell prediction limit of 5 mg/L, which is significantly lower than the Maximum Concentration Limit (MCL) of 250 mg/L. This record will be re-evaluated during the next background update.

Regarding Appendix I and III well/constituent pairs with a statistically significant decrease in median concentrations, all records were updated with compliance data as all cases (with the exception of boron, calcium, selenium, sulfate, and TDS at well GWC-5) contained compliance data at or below the reporting limit. For the aforementioned constituents at well GWC-5, background data were updated through December 2022, and elevated concentrations reported earlier in the record were truncated in order to construct statistical limits that are conservative (i.e., lower) from a regulatory perspective and are more representative of present-day groundwater quality conditions. For the same reasons, earlier concentrations for chloride at well GWC-5 were also truncated from the record, even though the difference in medians was not statistically significant.

The Mann Whitney test did not identify significant differences in medians for lead; however, it was noted during the previous update that historical data prior to 2016 are variable and appear to represent a sampling or analysis error. Therefore, all historical data prior to 2016 for lead were truncated so that resulting prediction limits are conservative (i.e., lower) from a regulatory perspective.

Due to variable concentrations, a trend test was previously recommended in lieu of prediction limits for selenium at well GWC-5 until at least the most recent 8 observations had stabilized at lower concentrations. Since no significant trends were identified for selenium among the most recent concentrations at the 99% confidence level and data appear to have stabilized, intrawell prediction limits were constructed using a truncated record as described above.

A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods will be re-evaluated during the next background update.

Trend Tests

For constituents requiring interwell prediction limits (arsenic and silver), the Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells at the 99% confidence level. As mentioned above, in the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend, thus reducing variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. No significant trends were identified among upgradient wells for arsenic and silver; therefore, no further action was necessary. Complete graphical results of the trend tests were included with the previous update.

Prediction Limits - Appendix I & III Constituents – August 2024

Intrawell limits were used to evaluate all Appendix I and III constituents in this analysis with the exception of arsenic and silver, which use interwell limits. In cases where intrawell analyses are recommended and downgradient average concentrations are higher than upgradient observed concentrations for a given constituent, the current assumption is that the higher upgradient concentrations are due to spatial variation rather than a result

of practices at the landfill. The pre-waste data support this logic, as well as the alternate source demonstrations prepared by Golder Associates.

When there is not an obvious explanation for observed concentration differences in downgradient wells relative to reported concentrations in upgradient wells (such as arsenic and silver), interwell prediction limits will initially be selected for the statistical method until further evidence shows that concentrations are due to spatial variation rather than a result of the facility.

Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through December 2022, except for cases mentioned above, within each well with detections for Appendix I constituents (antimony, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc) and Appendix III constituents (boron, calcium, chloride, fluoride, pH, sulfate, and TDS) (Figures D & E respectively). No statistical analyses were required for well/constituent pairs containing 100% non-detects.

As discussed earlier, the most recent reporting limit is substituted on a well-by-well basis for computing intrawell prediction limits. Therefore, individual wells can have different substitutions for a given parameter depending on what the laboratory has reported for each well. Note that the intrawell prediction limits slightly changed compared to the limits established during the background update for vanadium at downgradient well GWC-8A and sulfate at downgradient well GWC-10 due to a Sanitas™ software update that performs a substitution of ½ the most recent reporting limit when <15% non-detects are present in the background data set rather than an entire data set. No significant changes to statistical limits occurred as a result.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When resamples confirm the initial exceedance, an SSI is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. The following statistical exceedances were noted for the intrawell prediction limits:

Appendix I

- Barium: GWC-14, GWC-19, GWC-20, and GWC-4
- Chromium: GWA-16 (upgradient) and GWC-7
- Nickel: GWC-2

Appendix III

- Boron: GWC-4 and GWC-6
- Calcium: GWA-16 (upgradient), GWC-14, GWC-19, GWC-20, GWC-4, GWC-7, and GWC-9
- Chloride: GWC-10, GWC-14, GWC-4, GWC-7, and GWC-9
- Sulfate: GWC-10, GWC-3, GWC-4, GWC-7, and GWC-9
- TDS: GWC-4

Two-Step Approach

Following the two-step analysis procedure discussed above, interwell prediction limits were then constructed using pooled upgradient well data through August 2024 to evaluate the Appendix I and III apparent intrawell prediction limit exceedances (Figures F and G, respectively). The following statistical exceedances were noted for the interwell prediction limits:

Appendix I

- Barium: GWC-4
- Chromium: GWC-7
- Nickel: GWC-2

Appendix III

- Boron: GWC-4 and GWC-6
- Calcium: GWC-19, GWC-20, GWC-4, GWC-7, and GWC-9
- Chloride: GWC-4
- Sulfate: GWC-10, GWC-3, GWC-4, and GWC-9
- TDS: GWC-4

Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were then constructed using all pooled upgradient well data through August 2024 to develop background limits for arsenic and silver (Figure H). No statistical exceedances were noted for the interwell prediction limits. Summary tables of the intrawell and interwell prediction limits follow this letter along with the complete graphical results. The interwell limits are updated

during each analysis after screening for new outliers on the current upgradient well data, while the intrawell prediction limits are updated when a minimum of four new compliance observations is available.

Trend Tests

When prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are significantly increasing, decreasing, or stable (Figure I). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site which is an indication of variability in groundwater unrelated to practices at the site.

A summary of the trend tests follows this letter along with complete graphical results of the trend analysis. Statistically significant trends were noted for the following well/constituent pairs:

Increasing:

- Barium: GWC-19 and GWC-4
- Calcium: GWA-17 (upgradient), GWC-14, GWC-19, GWC-4, and GWC-7
- Chloride: GWA-15 (upgradient), GWC-10, GWC-14, GWC-4, and GWC-7
- Chromium: GWA-16 and GWA-17 (both upgradient)
- Sulfate: GWA-15 (upgradient), GWC-10, and GWC-4
- TDS: GWC-4

Decreasing:

- Barium: GWA-17 (upgradient)
- Chloride: GWA-17 (upgradient)

Resample Reports – November 2024

Resamples were collected in November 2024 based on the results of the two-step approach for the following well/constituent pairs:

- Boron: GWC-4 and GWC-6
- Calcium: GWC-9
- Chromium: GWC-7
- Nickel: GWC-2
- Sulfate: GWC-3 and GWC-9

Additional resamples for pH at downgradient wells GWC-2, GWC-3, GWC-4, GWC-6, GWC-7, and GWC-9 were also collected. Intrawell prediction limits were constructed using background data through December 2022 to compare the November 2024 resamples for Appendix I and III parameters (Figures J and K). Exceedances were identified for the following well/constituent pairs:

Appendix I

- Chromium: GWC-7

Appendix III

- Calcium: GWC-9
- pH: GWC-7
- Sulfate: GWC-3 and GWC-9

In accordance with the two-step approach, interwell prediction limits were constructed to evaluate the apparent exceedances (Figures L and M). Exceedances were identified for the following well/constituent pairs:

Appendix I

- Chromium: GWC-7

Appendix III:

- Calcium: GWC-9
- Sulfate: GWC-3 and GWC-9

Summary

Based on the results of the two-step approach and resamples, apparent intrawell prediction limit exceedances also exceeded the interwell prediction limits for the following well/constituent pairs:

Appendix I

- Barium: GWC-4
- Chromium: GWC-7

Appendix III

- Calcium: GWC-19, GWC-20, GWC-4, GWC-7, and GWC-9
- Chloride: GWC-4
- Sulfate: GWC-10, GWC-3, GWC-4, and GWC-9
- TDS: GWC-4

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Scherer Cell 1 Landfill. If you have any questions or comments, please feel free to contact us.

Sanitas™ v.10.0.22 . UG
 Hollow symbols indicate censored values.
 Exceeds Limit: GWC-4

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 111 background values. 1.802% NDs. Annual per-constituent alpha = 0.005418. Individual comparison alpha = 0.0001598 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

Constituent: Barium, Total Analysis Run 9/16/2024 1:49 PM View: Appendix I - Exceedances
 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Sanitas™ v.10.0.22 . UG
 Exceeds Limit: GWC-7

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 111 background values. 33.33% NDs. Annual per-constituent alpha = 0.005418. Individual comparison alpha = 0.0001598 (1 of 2). Assumes 16 future values.

Constituent: Chromium, Total Analysis Run 9/16/2024 1:49 PM View: Appendix I - Exceedances
 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Sanitas™ v.10.0.22 . UG
 Hollow symbols indicate censored values.
 Exceeds Limit: GWC-2

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 95 background values. 83.16% NDs. Annual per-constituent alpha = 0.007213. Individual comparison alpha = 0.0002129 (1 of 2). Assumes 16 future values.

Sanitas™ v.10.0.22 . UG
 Hollow symbols indicate censored values.
 Exceeds Limit: GWC-4, GWC-6

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 69 background values. 97.1% NDs. Annual per-constituent alpha = 0.01327. Individual comparison alpha = 0.0003928 (1 of 2). Comparing 2 points to limit. Assumes 15 future values.

Exceeds Limit: GWC-19, GWC-20, GWC-4,
 GWC-7, GWC-9

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 69 background values. Annual per-constituent alpha = 0.01327. Individual comparison alpha = 0.0003928 (1 of 2). Comparing 6 points to limit. Assumes 11 future values.

 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Sanitas™ v.10.0.22 . UG

Exceeds Limit: GWC-4

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 69 background values. Annual per-constituent alpha = 0.01327. Individual comparison alpha = 0.0003928 (1 of 2). Comparing 5 points to limit. Assumes 12 future values.

Constituent: Chloride Analysis Run 9/16/2024 7:48 PM View: Appendix III - Exceedances
 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Sanitas™ v.10.0.22 . UG

Hollow symbols indicate censored values.
 Exceeds Limit: GWC-10, GWC-3, GWC-4,
 GWC-9

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 69 background values. 68.12% NDs. Annual per-constituent alpha = 0.01327. Individual comparison alpha = 0.0003928 (1 of 2). Comparing 5 points to limit. Assumes 12 future values.

Constituent: Sulfate Analysis Run 9/16/2024 7:48 PM View: Appendix III - Exceedances
 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Exceeds Limit: GWC-4

Prediction Limit Interwell Parametric

Background Data Summary: Mean=71.36, Std. Dev.=30.91, n=69, 2.899% NDs. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9836, critical = 0.951. Kappa = 2.128 (c=7, w=17, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0004426. Assumes 16 future values.

Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 111 background values. 97.3% NDs. Annual per-constituent alpha = 0.005418. Individual comparison alpha = 0.0001598 (1 of 2). Comparing 17 points to limit.

Constituent: Arsenic, Total Analysis Run 9/16/2024 1:55 PM View: Appendix I - Interwell
 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. All background values (n = 96) were censored; limit is most recent reporting limit. Annual per-constituent alpha = 0.007067. Individual comparison alpha = 0.0002086 (1 of 2). Comparing 17 points to limit.

Exceeds Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 33 background values. Well-constituent pair annual alpha = 0.003399. Individual comparison alpha = 0.001701 (1 of 2).

Constituent: Chromium, Total Analysis Run 12/2/2024 10:38 AM View: Appendix I - Resample

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. All background values (n = 19) were censored; limit is most recent reporting limit. Well-constituent pair annual alpha = 0.009641. Individual comparison alpha = 0.004832 (1 of 2).

Constituent: Boron Analysis Run 12/2/2024 10:48 AM View: Appendix III - Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 19 background values. 89.47% NDs. Well-constituent pair annual alpha = 0.009641. Individual comparison alpha = 0.004832 (1 of 2).

Constituent: Boron Analysis Run 12/2/2024 10:48 AM View: Appendix III - Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Exceeds Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 20 background values. Well-constituent pair annual alpha = 0.008564. Individual comparison alpha = 0.004291 (1 of 2).

Constituent: Calcium Analysis Run 12/2/2024 10:48 AM View: Appendix III - Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Within Limits

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 21 background values. Well-constituent pair annual alpha = 0.01596. Individual comparison alpha = 0.007998 (1 of 2).

Constituent: pH Analysis Run 12/2/2024 10:48 AM View: Appendix III - Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Within Limits

Prediction Limit
Intrawell Parametric

Background Data Summary: Mean=5.955, Std. Dev.=0.1016, n=22. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.9136, critical = 0.878. Kappa = 2.406 (c=7, w=17, 1 of 2, event alpha = 0.05132). Report alpha = 0.0004426.

Constituent: pH Analysis Run 12/2/2024 10:48 AM View: Appendix III - Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Appendix I Interwell Prediction Limits - Two-Step 11/2024 Resample - All/Significant

Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR Printed 12/2/2024, 10:45 AM

Constituent	Well	Upper Lim.	Lower Lim.	Date	Observ.	Sig.	Bg	NBg	Mean	Std. Dev.	%NDs	ND Adj.	TransformAlpha	Method
Chromium, Total (mg/L)	GWC-7	0.012	n/a	11/6/2024	0.02	Yes	111	n/a		n/a	33.33	n/a	n/a	0.0001598 NP Inter (normality) 1 of 2

Exceeds Limit: GWC-7

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 111 background values. 33.33% NDs. Annual per-constituent alpha = 0.005418. Individual comparison alpha = 0.0001598 (1 of 2). Assumes 16 future values.

GROUNDWATER STATS CONSULTING

January 31, 2025

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Scherer PAC Landfill
Statistical Analysis – August 2024

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the groundwater statistical analysis for the 2024 2nd Semi-Annual Groundwater Monitoring Statistical Analysis sample event for Georgia Power Company's Plant Scherer PAC Landfill. The analysis complies with the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the Coal Combustion Residuals (CCR) program in 2016. Semi-annual sampling for 16 parameters began in 2010 in accordance with the Georgia Department of Natural Resources, Environmental Protection Division (Georgia EPD) groundwater monitoring regulations. At least 8 background samples have been collected at each of the groundwater monitoring wells.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-21, GWA-22, GWA-45, GWA-46, GWA-47, GWA-48, and GWA-49
- **Downgradient wells:** GWC-29, GWC-50, GWC-51, GWC-52, and GWC-53

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

Resamples were collected in November 2022 for TDS at wells GWA-45, GWA-46, GWA-47, GWA-48, GWA-49, GWC-29, GWC-50, GWC-51, GWC-52, and GWC-53 due to the August 2022 samples and October 2022 resamples being out of holding times. Per request of WSP, the samples that exceeded hold times for TDS are not included in the Sanitas database. Resamples were also collected for pH at these wells in October and November 2022 and all pH samples were retained in the database.

The following constituents were evaluated:

- **CCR Appendix III** - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I** - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Due to varying detection limits in data sets, generally due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. In the case of zinc, the reporting limit during the March 2023 sample event increased to 0.015 mg/L from the previous reporting limit of 0.005 mg/L. In order to maintain conservative limits, the current reporting limit of 0.005 mg/L was substituted for all wells. In the case of fluoride, varying reporting limits resulted from different laboratories for the February/March 2024 event; therefore, a reporting limit of 0.1 mg/L was substituted across all wells to maintain statistical limits that are conservative from a regulatory perspective.

Time series plots for CCR Appendix III and Georgia EPD Appendix I parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have

been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided during the background update discussed below to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc)
- # Constituents: 15 (silver was 100% non-detects in all downgradient wells)
- # Downgradient wells: 5

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (boron, calcium, chloride, fluoride, pH, sulfate, and TDS)
- # Constituents: 7
- # Downgradient wells: 5

Statistical analyses are not required when 100% non-detects are present in downgradient wells for a given constituent; therefore, no prediction limits were required for silver. A summary of all Appendix I well/constituent pairs with 100% non-detects follows this letter.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive

rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to spatial variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of spatial variation rather than facility impacts.

A second step can be used to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSIs) that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resamples confirm the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase.

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial variation rather than a result of impact to groundwater quality downgradient of the facility.

Summary of Background Screening – CCR Appendix III – Conducted in 2017

The original background screening for Appendix III constituents was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database and excluded prior to construction of statistical limits. Intrawell prediction limits, combined with a 1-of-2 resample plan, were recommended. The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach.

Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical background data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient background water quality is unimpacted compared to upgradient water quality for the same parameter. Based on the results of the original background screening, intrawell tests were recommended for all Appendix III parameters.

Summary of Background Screening Georgia EPD Appendix I - Conducted in August 2019

Outlier and Trend Testing

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of Tukey's outlier test as well as a discussion of potential outliers and flagged values were included with the background screening report.

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trends

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses showed several statistically significant increasing and decreasing trends; however, the majority of these were relatively low in magnitude when compared to average concentrations and, therefore, required no adjustments. It was noted that several of the upgradient wells had higher reported measurements in the earliest part of the records for some of the metals. These values were not deselected at this time since the measurements serve as reference data upgradient of the facility. If similar measurements are observed at a later time in one or more downgradient wells, the earlier upgradient data may indicate that the change is occurring rather than a result of practices at the facility. Lastly, while there was an overall increasing trend in concentrations for cobalt at well GWC-53, data are highly variable and similar to concentrations that have historically been reported in upgradient well GWA-45. Therefore, no adjustment was made to this record at that time.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach.

Generally, constituents without significant differences, based on ANOVA across upgradient wells, may be considered for interwell analysis. However, the Scherer PAC Landfill is lined, and pre-waste data are available that show metals were present in low level detections during the collection of background data. Furthermore, for some constituents, the reported concentrations are higher in upgradient wells than in

downgradient wells. This would result in interwell limits that would not readily detect changes in the downgradient wells with lower concentrations. Therefore, intrawell prediction limits are recommended as the most appropriate statistical analysis for all of the Georgia EPD constituents at this landfill.

Summary of Background Updates – Georgia EPD Appendix I and CCR Appendix III

June 2021

Outlier Analysis

Prior to updating background data, visual screening was used to evaluate data for suspected outliers in upgradient and downgradient wells through September 2020. All of the more recent compliance measurements appeared stable compared to the previously screened historical data sets; therefore, no new outliers were flagged except for a high value for lead (0.0034 mg/L) in well GWC-52 in order to maintain conservative (i.e., lower) statistical limits. A summary of all flagged outliers follows this letter. Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents requiring intrawell prediction limits (all Georgia EPD Appendix I and CCR Appendix III constituents in this instance), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through October 2018 to the new compliance samples at each well through September 2020. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not performed. A list of well/constituent pairs with no variation was included in the background update report. When the medians of the two groups are not statistically significantly different at the 99% confidence level, background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding updating background records were included with the background update report. A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods were re-evaluated during the next background update.

May 2023

Outlier Analysis

Prior to updating background data, visual screening and Tukey's outlier test was used to evaluate data for suspected outliers in upgradient and downgradient wells through November 2022. All previously flagged values were confirmed either by Tukey's test or visual screening; therefore, no new outliers were flagged except for a historic high value for vanadium in upgradient well GWA-47 (0.041 mg/L) that was flagged reduce variation in the record. Due to an increasing trend in the most recent data for barium at upgradient well GWA-45, observations between September 2019 and April 2021 in this well were not included in the interwell limit. The observations were flagged with an "L" flag and are included in the Outlier Summary, which shows all flagged outliers (Figure C). Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents requiring intrawell prediction limits (all Georgia EPD Appendix I and CCR Appendix III constituents), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through September 2020 to the new compliance samples at each well through August 2022 (November 2022 for pH and TDS), which would include all observations prior to the compliance sample in 2023. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not used. When the medians of the two groups are not statistically significantly different at the 99% confidence level (either an increase or decrease), background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test showed statistically significant differences for the following well/constituent pairs:

Increase:

- Barium: GWA-45, GWA-46 (both upgradient), GWC-29, GWC-50, and GWC-52
- Boron: GWA-45 (upgradient)
- Calcium: GWC-29 and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), GWC-51, and GWC-53
- Chromium: GWC-51 and GWC-52
- Nickel: GWC-50
- pH: GWC-29 and GWC-51
- Sulfate: GWC-52
- Vanadium: GWA-21 (upgradient)

Decrease:

- Antimony: GWA-47, GWA-48 (both upgradient), and GWC-51
- Arsenic: GWA-48 (upgradient)
- Barium: GWC-53
- Beryllium: GWA-22 (upgradient)
- Calcium: GWA-45 (upgradient)
- Cobalt: GWC-29, GWC-50, and GWC-51
- Fluoride: GWC-53
- Lead: GWA-22 (upgradient), GWC-50, and GWC-53
- Nickel: GWA-45 (upgradient)
- Thallium: GWC-51
- Zinc: GWA-45 (upgradient)

For both Appendix I and III well/constituent pairs with a statistically significant increase in median concentrations, the following records were not updated with data through August 2022 in order to maintain statistical limits that are conservative from a regulatory perspective:

- Chromium: GWC-52
- Sulfate: GWC-52

The remaining records with statistically significant increases were updated through August 2022 (November 2022 for pH) and are listed below. For upgradient wells, the increasing concentrations are assumed to result from spatial variation and to represent unimpacted background conditions. The increases in downgradient wells appear to be close to historic concentrations in the same well or resemble concentrations from an upgradient well and would have little to no impact on resulting statistical limits:

- Boron: GWA-45 (upgradient)
- Barium: GWA-45 (upgradient), GWA-46 (upgradient), GWC-29, GWC-50, and GWC-52
- Calcium: GWC-29 and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), GWC-51, and GWC-53
- Chromium: GWC-51
- Nickel: GWC-50
- pH: GWC-29 and GWC-51

Regarding Appendix I and III well/constituent pairs with a statistically significant decrease in median concentrations, all records were updated with compliance data as all concentrations (with the exception of barium at GWC-53) were reported as trace values

(i.e., below the reporting limit). For barium at GWC-53, background data were updated through August 2022, and elevated background concentrations in the early part of the record were truncated in order to construct statistical limits that are conservative (i.e., lower) from a regulatory perspective and are more representative of present-day groundwater quality conditions.

The Mann Whitney test did not identify significant differences in medians for lead; however, historical data prior to 2016 are more variable than more recent concentrations. Therefore, all historical data prior to 2016 for lead were truncated at all wells so that resulting prediction limits are conservative (i.e., lower) from a regulatory perspective. Additionally, lower concentrations early in the record for boron at upgradient well GWA-45 were truncated in order to eliminate the overall increasing trend and construct statistical limits that are more conservative.

A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods will be re-evaluated during the next background update.

Statistical Analysis of Georgia EPD Appendix I Constituents – August 2024

Intrawell limits were constructed for all Georgia EPD Appendix I constituents. In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent, the current assumption is that the higher downgradient concentrations are due to spatial variation rather than a result of practices at the landfill. The pre-waste data support this logic.

Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August 2022 within each well for constituents with detections (Figure D). As mentioned above, the Date Range summary provides the period of record used for well/constituent pairs where records have been truncated, The August 2024 compliance samples were compared to these intrawell background limits. As previously discussed, no statistical analyses were included for silver since all records contain 100% non-detects in downgradient wells, or for other individual well/constituent pairs containing 100% non-detects.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance

is confirmed. When resamples confirm the initial exceedance, an SSI is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary table of the background intrawell prediction limits and exceedances follows this letter, along with the complete graphical results. Statistical exceedances were noted for the following well/constituent pairs:

- Arsenic: GWA-46, GWA-47, GWA-49 (all upgradient), GWC-50, and GWC-52
- Barium: GWA-46 (upgradient) and GWC-52
- Chromium: GWA-22 (upgradient) and GWC-52

Two-Step Analysis

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data through March 2024 to evaluate the initial intrawell prediction limit exceedances listed above in downgradient wells (Figure E). No exceedances were identified.

Trend Tests

When initial prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are significantly increasing, decreasing, or stable (Figure F). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site. Trends in upgradient trends are an indication of variability in groundwater unrelated to practices at the site. Both a summary and complete graphical results of the trend tests follow this letter. Statistically significant trends were noted for the following well/constituent pairs:

Increasing:

- Barium: GWA-45, GWA-46 (both upgradient), and GWC-52
- Chromium: GWA-22 (upgradient) and GWC-52

Decreasing:

- Barium: GWA-22 (upgradient)
- Chromium: GWA-21 (upgradient)

Note that the cause of the trend for chromium at GWC-52 is pending and requires further analysis beyond the scope of this analysis. If research shows these higher concentrations

reflect spatial variation, the earlier portion of the record may require deselection so that resulting limits are reflective of present-day water quality conditions.

Statistical Analysis of Appendix III Parameters – August 2024

Intrawell prediction limits for all Appendix III parameters, combined with a 1-of-2 resample plan, were constructed using all historical data through August 2022, except for pH and TDS which use historical data through November 2022 (Figure G). The August 2024 compliance data were compared to those limits.

As discussed earlier, the most recent reporting limit is substituted on a well-by-well basis for computing intrawell prediction limits. Therefore, individual wells can have different substitutions for a given parameter depending on what the laboratory has reported for each well. Note that the intrawell prediction limit changed compared to those established during the background update for fluoride at most wells as a result of the most recent reporting limit replacing historic non-detects. No significant changes to statistical limits occurred as a result and all August 2024 observations for fluoride were non-detects

Prediction Limits

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. A summary table of the Appendix III prediction limits follows this letter, along with complete graphical results. The following prediction limit exceedances were noted for Appendix III parameters:

- Boron: GWC-53
- Calcium: GWA-47 (upgradient), GWC-29, GWC-51, GWC-52, and GWC-53
- Chloride: GWA-45 (upgradient) and GWC-53
- pH (lower limit): GWA-45 (upgradient)
- Sulfate: GWA-45 (upgradient), GWC-51, GWC-52, and GWC-53
- TDS: GWC-52

Two-Step Analysis

Following the two-step analysis procedure as mentioned above, interwell prediction limits were then constructed using pooled upgradient well data through August 2024 to evaluate the apparent initial intrawell prediction limit exceedances listed above at downgradient wells (Figure H). Exceedances were identified for the following well/constituent pairs:

- Chloride: GWC-53
- Sulfate: GWC-53

It was noted that upgradient well GWA-45, which is included in the interwell background and represents groundwater quality upgradient of the site, has higher concentrations than neighboring upgradient wells for several of the Appendix III constituents. Therefore, the interwell comparisons for downgradient wells with reported lower concentration levels need to be interpreted cautiously and are further evaluated through trend analysis as described below.

Trend Tests

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure I). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary and complete the trend test results follow this letter. The following statistically significant trends were identified:

Increasing:

- Boron: GWA-45 (upgradient)
- Calcium: GWA-46, GWA-47 (both upgradient), GWC-29, GWC-51, and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), and GWC-53
- Sulfate: GWA-21, GWA-45 (both upgradient), GWC-51, GWC-52, and GWC-53
- TDS: GWA-21, GWA-45, GWA-47 (all upgradient), and GWC-52

Decreasing:

- Calcium: GWA-45 (upgradient)
- Chloride: GWA-22 (upgradient)

Resample Reports – November 2024

A resample was collected in November 2024 based on the results of the two-step approach for the following well/constituent pairs:

- Chloride: GWA-45 (upgradient) and GWC-53
- pH: GWA-45 (upgradient)
- Sulfate: GWA-45 (upgradient) and GWC-53

An additional resample for pH at downgradient well GWC-53 was also collected. Intrawell prediction limits were constructed using background data through August 2022 to compare the November 2024 resamples for chloride, pH, and sulfate at wells GWA-45 and GWC-53 (Figure J). Exceedances were identified for the following well/constituent pairs:

- Chloride: GWC-53
- Sulfate: GWC-53

In accordance with the two-step approach, interwell prediction limits were constructed to evaluate the apparent exceedances (Figure K). No exceedances were identified.

Summary

Observations from the August 2024 sample event at Scherer PAC were compared to established intrawell prediction limits for all Appendix I and III constituents. For parameters using intrawell prediction limits, the two-step approach followed by trend testing was used to evaluate apparent exceedances. Based on the results of the two-step approach for the August 2024 observations and the November 2024 resamples, no exceedances were identified.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Scherer PAC Landfill. If you have any questions or comments, please feel free to contact us.

Time Series

Constituent: Arsenic, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Arsenic, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Barium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Hollow symbols indicate censored values.

Time Series

Constituent: Barium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Hollow symbols indicate censored values.

Time Series

Constituent: Beryllium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Hollow symbols indicate censored values.

Time Series

Constituent: Beryllium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Boron Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Boron Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Cadmium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Cadmium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Calcium Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Calcium Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Chloride Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Hollow symbols indicate censored values.

Time Series

Constituent: Chloride Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Chromium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Chromium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Cobalt, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Cobalt, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Copper, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Copper, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Fluoride Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Fluoride Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Lead, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Lead, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Mercury, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Mercury, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Nickel, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Nickel, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: pH Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: pH Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Selenium, Total Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Selenium, Total Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Silver, Total Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Silver, Total Analysis Run 12/2/2024 12:47 PM
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Sulfate Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Sulfate Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Thallium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Thallium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Total Dissolved Solids Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Total Dissolved Solids Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Vanadium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Vanadium, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Zinc, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Zinc, Total Analysis Run 12/2/2024 12:47 PM
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Time Series

Constituent: Antimony, Total (mg/L) Analysis Run 12/2/2024 12:48 PM

Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Sanitas™ v.10.0.17a . UG
Hollow symbols indicate censored values.
Within Limit

Prediction Limit Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 32 background values. 96.88% NDs. Well-constituent pair annual alpha = 0.003603. Individual comparison alpha = 0.001803 (1 of 2).

Constituent: Antimony, Total Analysis Run 9/11/2024 6:07 PM View: Appendix I - Intrawell

Sanitas™ v.10.0.22 . UG
 Hollow symbols indicate censored values.
 Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 250 background values. 96% NDs. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Comparing 2 points to limit. Assumes 3 future values.

Constituent: Arsenic, Total Analysis Run 9/24/2024 2:36 PM View: Appendix I - Interwell
 Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Sanitas™ v.10.0.22 . UG
 Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 243 background values. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Assumes 4 future values.

Sanitas™ v.10.0.22 . UG
 Hollow symbols indicate censored values.
 Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 250 background values. 17.6% NDs. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Assumes 4 future values.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 161 background values. 77.64% NDs. Annual per-constituent alpha = 0.0007573. Individual comparison alpha = 0.00007576 (1 of 2). Assumes 4 future values.

Constituent: Boron Analysis Run 9/23/2024 12:33 PM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 161 background values. Annual per-constituent alpha = 0.0007573. Individual comparison alpha = 0.00007576 (1 of 2). Comparing 4 points to limit. Assumes 1 future value.

Constituent: Calcium Analysis Run 9/23/2024 12:33 PM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Exceeds Limit: GWC-53

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 160 background values. Annual per-constituent alpha = 0.0007653. Individual comparison alpha = 0.00007656 (1 of 2). Assumes 4 future values.

Constituent: Chloride Analysis Run 9/23/2024 12:33 PM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Hollow symbols indicate censored values.

Exceeds Limit: GWC-53

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 161 background values. 39.75% NDs. Annual per-constituent alpha = 0.0007573. Individual comparison alpha = 0.00007576 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

Constituent: Sulfate Analysis Run 9/23/2024 12:33 PM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limit

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 160 background values. 0.625% NDs. Annual per-constituent alpha = 0.0007653. Individual comparison alpha = 0.00007656 (1 of 2). Assumes 4 future values.

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.05 alpha level. Limit is highest of 19 background values. Well-constituent pair annual alpha = 0.009641. Individual comparison alpha = 0.004832 (1 of 2).

Constituent: Chloride Analysis Run 12/2/2024 12:59 PM View: Appendix III - Intrawell Resample

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 161 background values. Annual per-constituent alpha = 0.0007573. Individual comparison alpha = 0.00007576 (1 of 2). Assumes 4 future values.

Certification

This *Alternate Source Demonstration, Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102-009D(CCR), 2023 Second Semi-Annual Monitoring Event*, has been prepared in compliance with the United States Environmental Protection Agency Coal Combustion Residual Rule (40 Code of Federal Regulations [CFR] 257 Subpart D), specifically § 257.90(e), and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with WSP USA Inc. I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management 391-3-4-.01.

WSP USA Inc. certifies that monitored constituents were below the applicable Georgia maximum contaminant levels.

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) has been prepared on behalf of Georgia Power Company (Georgia Power) by WSP USA, Inc. (WSP) in accordance with 40 CFR § 257.90(e) of the Federal Coal Combustion Residuals (CCR) Rule and 391-3-4-.10 of the Georgia (GA) Solid Waste Management Rules to address the statistically significant increases (SSIs) of constituents over background concentrations.

These SSIs were reported in the *2023 Annual Groundwater Monitoring and Corrective Action Report* dated January 31, 2024, for the August 2023 semi-annual groundwater sampling event at Georgia Power's Plant Scherer (Scherer) Cell 1 and Powdered Activated Carbon (PAC) Ash Cell (WSP, 2024). Within 90 days of the reported SSIs, in compliance with 391-3-4-.10, this report describes an alternate source and demonstrates that the SSIs are not the result of a release from Cell 1 or PAC Ash Cell, but rather due to natural variability in groundwater chemistry.

Semi-annual groundwater quality monitoring and reporting for the landfill units at Plant Scherer are performed in accordance with the Solid Waste Permit 102.009D(CCR); and the Site's *Groundwater Monitoring Plan*, and the CCR Rule 40 CFR § 257.90-98. The following sections address the statistical exceedances noted following the 2023 second semi-annual monitoring event and provide evidence that demonstrates an alternate source for these exceedances.

2.0 SITE DESCRIPTION

Plant Scherer is a coal-fired power generation facility located in northeast Monroe County approximately five miles south of Juliette, GA. The property occupies approximately 13,000 acres and is bounded on the south by Lake Juliette. The plant is primarily surrounded by agricultural and residential use. Figure 1 depicts the location of Plant Scherer relative to the surrounding area. The Site is located within the Piedmont Physiographic Province of central Georgia, which is characterized by gently rolling hills and narrow valleys, with locally pronounced linear ridges (Golder 2022a). Overall, the property slopes gently south towards Lake Juliette and east toward the Ocmulgee River (Figure 1).

The Plant Scherer Landfill consists of a two active cells, namely, Cell 1 and PAC Ash Cell (Figure 1). The two active cells have been used since 2011 for the disposal of CCR. The landfill is situated on a topographically high area of the property east/southeast of the ash pond. The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system. Figures 2 and 3 depict the general configuration of Cell 1 and the PAC Ash Cells along with the potentiometric surface inferred from groundwater elevations measured in the monitoring well network on July 31, 2023. Figure 4 presents a hydrograph of groundwater elevations for wells around Cell 1.

3.0 EVALUATION OF ANALYTICAL RESULTS & STATISTICAL ANALYSES

As presented in the *2023 Annual Groundwater Monitoring and Corrective Action Report*, detected concentrations of target constituents are below the established prediction limits (PLs) in groundwater samples collected during the August 2023 sampling event with the exception of barium, calcium, TDS, sulfate in various wells at Cell 1 and chloride in well GWC-53 at PAC Ash Cell.

Verification sampling conducted in October 2023 confirmed the SSI of chloride in GWC-53. The SSIs that had been identified previously and identified again in the 2023 second semi-annual event data were not re-sampled in

October 2023. The SSIs noted at the Site are below applicable primary or secondary maximum contaminant levels (MCLs) for drinking water.

This report documents an Alternate Source Demonstration (ASD) to address the SSIs above background concentrations. Prior ASDs have been prepared to address the SSIs of barium, calcium, sulfate, and TDS at GWC-4 and calcium at GWC-8A and GWC-19. Table 1 summarizes the statistical exceedances above PLs following the August 2023 sampling event and subsequent October 2023 resampling results.

3.1 Statistical Analysis Method

The selected statistical evaluation procedure for Cell 1 and PAC Ash Cell was developed using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, (Unified Guidance) (USEPA March 2009). Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision-support software package that incorporates the statistical tests required of Subtitle C and D facilities by United States Environmental Protection Agency (USEPA) regulations and as recommended in the Unified Guidance.

During detection monitoring at the Site, groundwater quality data are evaluated using a two-step statistical approach (i.e., intrawell followed by interwell PLs). The statistical method(s) use an optional 1-of-2 verification resample plan. Intrawell statistical analyses methods are evaluated for each well and constituent pair. For an apparent SSI, a second step of interwell comparisons is performed. An SSI is declared when downgradient well data exceed both intrawell and interwell PLs.

3.2 Statistical Analysis Results

The calculated prediction limits and the statistical analysis (Sanitas) results are included in *2023 Annual Groundwater Monitoring and Corrective Action Report* (WSP 2024).

Using the statistical methods described above, including the two-step analyses, the following SSIs are noted following the second semi-annual 2023 monitoring event including both the August sample event and the October 2023 verification sampling event.

Parameter	Well ID
Cell 1	
Barium	GWC-4
Calcium	GWC-4, GWC-8A, GWC-19, GWC-20
TDS	GWC-4
Sulfate	GWC-4
PAC Ash Cell	
Chloride	GWC-53

4.0 ALTERNATE SOURCE DEMONSTRATION

In accordance with Rule § 391-3-4-.10 and 40 CFR § 257.90(e), the following discussion provides a demonstration that the SSIs identified following the August 2023 sampling event are not the result of a release from Cell 1 or the PAC Ash Cell. Prior ASDs were prepared for several of the SSIs identified following the August 2023 sampling event. Documentation of the prior ASDs is identified on Table 1 and has been summarized in this demonstration.

In general, SSIs can be attributed to natural variability in groundwater chemistry. The variations of metal concentrations at several wells across the Site reflect variations in groundwater flow and chemistry following repairs to the sedimentation ponds and the clear pool made in 2023 and on other occasions in previous years which have affected nearby monitoring wells.

4.1 Barium, Calcium, Sulfate, and TDS at GWC-4

The concentration of barium in groundwater at GWC-4 during the August 2023 monitoring event (0.085 mg/L) is slightly above the intrawell prediction limit (0.053 mg/L), but still substantially below the MCL of 2 mg/L (Figure 5). Barium is a naturally occurring alkaline earth metal commonly found in soils at a range of 10 to 5,000 mg/kg in soils across the United States, with an average concentration of 290 mg/kg in the Eastern United States (Smith and Huyck, 1999). Barium is typically found in groundwater as the divalent cation Ba^{2+} across a wide range of redox and pH conditions. As such barium is prevalent in Piedmont groundwater at concentrations typically higher than other metals (USGS 2013). Where barium concentrations are high in groundwater, it has been observed that there is low sulfate in groundwater, indicating barite [$BaSO_4$], a common mineral, is a likely control on the barium concentration in natural groundwater (Hem 1985). With a range of less than 30 parts per billion over the upper PL, such variations in barium and other metal concentrations in groundwater are expected due to natural variations in groundwater quality resulting from variations in groundwater flow. Monitoring well GWC-4 is located adjacent to the southern portion of the North Sedimentation Pond where liner installation and repairs have occurred since 2020.

Barium concentrations at well GWC-4 are comparable to the reported range of barium concentrations (0.02 to 0.12 mg/L) in the crystalline rock aquifers of the Piedmont (USGS 2009 and USGS 2013). Naturally occurring minerals such as barite are fairly common in the Piedmont and barite is easily dissolved under most geochemical conditions (USGS 2013). The decline in water levels, following installation of the North Sedimentation Pond, in several site monitoring wells since 2020 (Figure 4) is also a likely factor contributing to the variability in natural chemistry observed across the Site.

The calcium concentration at GWC-4 in August 2023 was 25 mg/L, compared to the PL of 17.6 mg/L (Figure 5). The calcium concentration in well GWC-4 is due to impacts from construction of the nearby North Sedimentation Pond, natural variations in groundwater flow, and mineral saturation and solubility rather than any release from the lined CCR landfill units, as demonstrated below utilizing boron as an indicator parameter and evaluating mineral saturation indices.

The TDS concentration at GWC-4 in August 2023 was 220 mg/L, compared to the intrawell PL of 178.1 mg/L (Figure 6). TDS concentrations have been elevated above the PL during prior sampling events in February 2023 (240 mg/L) and May 2023 (290 mg/L) but began to decrease in August 2023 (220 mg/L). The sulfate concentration at GWC-4 in August 2023 was 53 mg/L, compared to the intrawell PL of 6.288 mg/L (Figure 6). Elevated TDS and sulfate concentrations in well GWC-4 are due to impacts from construction of the nearby North

Sedimentation Pond, natural variations in groundwater flow, and mineral saturation and solubility rather than any release from the lined CCR landfill units.

Boron is a constituent in CCR materials that is commonly used as an indicator parameter in groundwater monitoring at CCR units because of its behavior as a conservative (non-reactive) element in groundwater flow (Ruhl 2014). Boron has not been detected throughout the monitoring history at GWC-4 (i.e., <0.060 mg/L, Figure 7), and chloride (another indicator parameter) concentrations at GWC-4 are below PLs (Figure 7); indicating that the detected SSIs are not the result of a release from the lined CCR landfill units. Mineral saturation indices (SIs)¹ for well GWC-4 are shown in Table 2. The SIs indicate that calcite (CaCO₃) and gypsum (CaSO₄) are undersaturated and barite (BaSO₄) is near equilibrium for the chemical composition of groundwater in well GWC-4. This means additional calcium and sulfate dissolution from the aquifer system remains favorable until chemical equilibrium (calcium, barium, and/or sulfate saturation) is achieved. The apparent increase in TDS concentrations above the PLs is attributable to mineral dissolution and re-equilibration, and such variations in metal concentrations are expected due to natural variations in groundwater flow in the overburden-fractured rock aquifer at the Site. Physical changes at the Site from engineering and construction activities can also cause these changes when soils rich in calcium and sulfide minerals are exposed to the surface with additional recharge resulting in leaching of these minerals. Additionally, excavation of vegetation and organic soils found in the sediment pond footprint (previously used for stormwater control), the addition of structural fill, and construction of a two-foot layer of compacted clay liner provide a site-specific source of soluble minerals. Overall, the groundwater quality in well GWC-4 reflects metal concentrations that are comparable to reported background concentrations in the nearby Piedmont areas (USGS 2013).

Groundwater elevations in well GWC-4 have slightly declined during the last two years but have increased slightly between the August 2022 event and August 2023 event (Figure 4). The changes in groundwater levels affect the pH and redox condition in the uppermost aquifer and subsequently, affect the kinetics of mineral dissolution or precipitation. Groundwater elevations at several of the Site wells (including GWC-4) have declined nearly five feet since 2019, likely due to the 2020 construction of the lined sedimentation pond.

Based on these facts, the elevated concentrations of barium, calcium, sulfate, and TDS at GWC-4 are not the result of a release from Cell 1 but rather due to natural variability in groundwater chemistry as a result of the change in recharge conditions and cation exchange reactions.

4.2 Calcium at GWC-8A, GWC-19, and GWC-20

An ASD for calcium at GWC-8A was last submitted in November 2022. The calcium concentrations in August 2023 at monitoring well GWC-8A was 53 mg/L, compared to the PL of 45.47 mg/L, the concentration at GWC-19 was 18 mg/L, compared to the PL of 15.99 mg/L, and the concentration at GWC-20 was 16 mg/L, compared to the PL of 15.76 mg/L (Table 1).

As shown on Figure 8, an inverse relationship is observed between calcium and sulfate. This further substantiates that natural variability is the source of the observed calcium concentrations in groundwater at the Site, as impacts from Cell 1 would demonstrate a calcium sulfate (gypsum) chemistry. General chemistry at GWC-8A compared to

¹ Mineral Saturation Index (SI) is a measure of whether a water will tend to dissolve or precipitate a particular mineral. An SI is negative when the mineral may be dissolved (i.e., it is present below its saturation concentration), positive when it may be precipitated (i.e., is above its saturation concentration), and zero when the water and mineral are at chemical equilibrium. The SI is calculated by comparing the chemical activities of the dissolved ions of the mineral (ion activity product, IAP) with their solubility product (K_{sp}). In equation form, $SI = \log(IAP/K_{sp})$.

upgradient groundwater monitoring wells is shown on a piper trilinear diagram presented as Figure 9. Review of the piper diagram shows that the dissolved constituent concentrations in these wells are similar to upgradient groundwater quality and do not indicate influence from Cell 1 and that GWC-8A plots consistent with upgradient groundwater quality and does not suggest influence of another source (i.e., Cell 1). Overall, the groundwater quality in wells GWC-8A, GWC-19, and GWC-20 reflects metal concentrations that are comparable to reported background concentrations in the nearby Piedmont areas (USGS 2013) and the variations in calcium in groundwater at GWC-8A, are due to natural variations in groundwater quality related to mineral saturation and solubility.

SIs for wells GWC-8A, GWC-19, and GWC-20 are shown in Table 2. The SI data indicate that calcite (CaCO_3) is undersaturated based on the chemical composition of groundwater in wells GWC-8A, GWC-19, and GWC-20. This condition means additional calcium dissolution from the aquifer system remains favorable until chemical equilibrium (calcium saturation) is achieved. The apparent increase in calcium concentrations above the PLs is attributed to mineral dissolution and re-equilibration, and such variations in metal concentrations are expected due to natural variations in groundwater flow in the overburden-fractured rock aquifer at the Site. Physical changes at the Site from engineering and construction activities can also cause these changes when soils rich in calcium and sulfide minerals are exposed to the surface with additional recharge resulting in leaching of these minerals. Additionally, excavation of vegetation and organic soils found in the sediment pond footprint (previously used for stormwater control), the addition of structural fill, and construction of a two-foot layer of compacted clay liner near GWC-19 and GWC-20, coupled with liner repairs and site maintenance at the lined pond near GWC-8A can provide a site-specific source of soluble minerals.

Groundwater elevations in wells GWC-19 and GWC-20 have slightly declined since March 2019 (Figure 4), since the over-excavation and lining of the North Sedimentation Pond. Construction, including the addition of 2,600 feet of underdrain, occurred at the Site. Construction of the drain, which occurred in December 2019, (Brantley 2020), corresponds to the observed increase in calcium GWC-19 and GWC-20.

The decreases in groundwater levels can affect the pH and redox condition in the uppermost aquifer and subsequently, affect the kinetics of mineral dissolution or precipitation. Groundwater elevations have declined nearly five feet in several of the Site wells (including GWC-19, and GWC-20) since 2019 (Figure 4).

4.3 Chloride at GWC-53

A SSI of chloride was identified at GWC-53 following the August 2023 sampling event and was confirmed during the October 2023 resampling event. Although the October 2023 resample result confirmed the concentration reported in August 2023, chloride concentrations during both events are only slightly above the adjacent upgradient background well GWA-45. The August 2023 concentration of chloride at GWC-53 at 14 mg/L and the October resample concentration of 15 mg/L is only slightly above the prediction limit for GWC-53 and the background chloride concentration at GWC-45, both at 13 mg/L. A time series for chloride at monitoring well GWC-53 is shown on Figure 10.

Primary indicator parameter, boron, has not been observed historically above the prediction limits at GWC-53. If the SSI of chloride reported in well GWC-53 was due to a release from the landfill, an increase in multiple indicator parameters would be expected but has not been observed. As a result, the increase in chloride concentration at GWC-53 is attributable to natural variations in groundwater chemistry.

5.0 CONCLUSIONS

This ASD has been prepared in response to apparent statistical exceedances presented in the *2023 Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Plant Scherer Cell 1 and PAC Ash Cell, Permit No. 102-009D(CCR)*, dated January 31, 2024. In accordance with 40 CFR § 257.90(e) and §391-3-4-.10 of the Georgia Solid Waste Management Rules, this ASD addresses each of the SSIs noted following the August 2023 sampling event.

Based on the data presented herein, SSIs from the August 2023 monitoring event are not the result of a release from the lined landfill units, but rather natural variability in groundwater quality. The lines of evidence include:

- The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system. There is no evidence of a release through the liner systems.
- Construction and repair of the lining of the North Sedimentation Pond has affected localized aquifer recharge and groundwater elevations in nearby wells.
- The reported concentrations of barium are within the range of concentrations expected in the overburden – fractured bedrock aquifers in samples from the Piedmont in the southeastern United States (USGS 2009; USGS 2013).
- The chemical composition of groundwater in wells GWC-8A, GWC-19, and GWC-20, are similar to upgradient groundwater (Figure 9).
- The chemical composition of groundwater in well GWC-53 is similar to upgradient well GWA-45.
- Boron, a primary indicator parameter for CCR, does not exhibit an SSI at wells GWC-4, GWC-8A, GWC-19, GWC-20 or GWC-53.
- Mineral saturation indices suggest that barium, chloride, sulfate, and TDS concentrations in groundwater in GWC-4, GWC-8A, GWC-19, and GWC-20 are affected by the natural mineral dissolution in the aquifer materials rather than a release from Cell 1.

The SSIs addressed above are below their primary or secondary MCLs. Based on the findings presented herein, Georgia Power will continue with detection groundwater monitoring at Cell 1 and PAC Ash Cell. A copy of this ASD will be included with the forthcoming Semi-Annual report.

Certification

This *Alternate Source Demonstration, Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102-009D(CCR), 2024 First Semi-Annual Monitoring Event*, has been prepared in compliance with the United States Environmental Protection Agency Coal Combustion Residual Rule (40 Code of Federal Regulations [CFR] 257 Subpart D), specifically § 257.90(e), and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with WSP USA Inc. I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management 391-3-4-.01.

WSP USA Inc. certifies that monitored constituents were below the applicable Georgia maximum contaminant levels.

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) has been prepared on behalf of Georgia Power Company (Georgia Power) by WSP USA, Inc. (WSP) in accordance with 40 CFR § 257.90(e) of the Federal Coal Combustion Residuals (CCR) Rule and 391-3-4-.10 of the Georgia (GA) Solid Waste Management Rules to address the statistically significant increases (SSIs) of constituents over background concentrations.

These SSIs were reported in the *2024 Semi-Annual Groundwater Monitoring and Corrective Action Report* dated August 30, 2024, for the February 2024 semi-annual monitoring event and the May 2024 verification resampling (February and May 2024) event at Georgia Power's Plant Scherer (Scherer) Cell 1 and Powdered Activated Carbon (PAC) Ash Cell (WSP, 2024b). Within 90 days of the reported SSIs, in compliance with 391-3-4-.10, this report describes an alternate source and demonstrates that the SSIs are not the result of a release from Cell 1 or PAC Ash Cell, but rather due to natural variability in groundwater chemistry.

Semi-annual groundwater quality monitoring and reporting for the landfill units at Plant Scherer are performed in accordance with the Solid Waste Permit 102.009D(CCR); and the Site's *Groundwater Monitoring Plan*, and the CCR Rule 40 CFR § 257.90-98. The following sections address the statistical exceedances noted following the 2024 first semi-annual monitoring event and provide evidence that demonstrates an alternate source for these exceedances.

2.0 SITE DESCRIPTION

Plant Scherer is a coal-fired power generation facility located in northeast Monroe County approximately five miles south of Juliette, GA. The property occupies approximately 13,000 acres and is bounded on the south by Lake Juliette. The plant is primarily surrounded by agricultural and residential use. Figure 1 depicts the location of Plant Scherer relative to the surrounding area. The Site is located within the Piedmont Physiographic Province of central Georgia, which is characterized by gently rolling hills and narrow valleys, with locally pronounced linear ridges (Golder 2022a). Overall, the property slopes gently south towards Lake Juliette and east toward the Ocmulgee River (Figure 1).

The Plant Scherer Landfill consists of two active cells, namely, Cell 1 and PAC Ash Cell (Figure 1). The two active cells have been used since 2011 for CCR. The landfill is situated on a topographically high area of the property east/southeast of the ash pond. The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system. Figures 2 and 3 depict the general configuration of Cell 1 and the PAC Ash Cells along with the potentiometric surface inferred from groundwater elevations measured in the monitoring well network on February 19, 2024. Figure 4 presents a hydrograph of groundwater elevations for wells around Cell 1.

3.0 EVALUATION OF ANALYTICAL RESULTS & STATISTICAL ANALYSES

As presented in the *2024 Semi-Annual Groundwater Monitoring and Corrective Action Report*, detected concentrations of target constituents are below the established prediction limits (PLs) in groundwater samples collected during the February 2024 sampling events with the exception of barium, nickel, zinc, calcium, chloride, pH, sulfate, and TDS, in various wells at Cell 1. Verification sampling conducted in May 2024 confirmed the SSIs of barium, calcium, chloride, sulfate and TDS. The SSIs noted at the Site are below applicable maximum contaminant levels (MCLs) for drinking water.

This report documents an Alternate Source Demonstration (ASD) to address the SSIs above background concentrations. Prior ASDs have been prepared to address the confirmed SSIs of barium, calcium, chloride, sulfate, and TDS at GWC-4, calcium at GWC-8A, GWC-19 and GWC-20, and sulfate at GWC-10. Table 1 summarizes the statistical exceedances above PLs following the February 2024 sampling event and subsequent May 2024 resampling results. Since the SSIs of nickel and zinc were not confirmed by resampling, these constituents are excluded in the following discussion.

3.1 Statistical Analysis Method

The selected statistical evaluation procedure for Cell 1 and PAC Ash Cell was developed using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, (Unified Guidance) (USEPA March 2009). Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision-support software package that incorporates the statistical tests required of Subtitle C and D facilities by United States Environmental Protection Agency (USEPA) regulations and as recommended in the Unified Guidance.

During detection monitoring at the Site, groundwater quality data are evaluated using a two-step statistical approach (i.e., intrawell followed by interwell PLs). The statistical method(s) use an optional 1-of-2 verification resample plan. Intrawell statistical analyses methods are evaluated for each well and constituent pair. For an apparent SSI, a second step of interwell comparisons is performed. An SSI is declared when downgradient well data exceed both intrawell and interwell PLs.

3.2 Statistical Analysis Results

The calculated prediction limits and the statistical analysis (Sanitas) results are included in *2024 Semi-Annual Groundwater Monitoring and Corrective Action Report (WSP 2024b)*.

Using the statistical methods described above, including the two-step analyses, the following SSIs are noted following the first semi-annual 2024 monitoring event including both the February sample event and the May 2024 verification sampling event. No SSIs were reported in the PAC Ash Cell wells.

Parameter	Well ID
Cell 1	
Barium	GWC-4*
Calcium	GWC-4*, GWC-7, GWC-8A*, GWC-19*, GWC-20*
Chloride	GWC-4*
Sulfate	GWC-4*, GWC-6, and GWC-10*
TDS	GWC-4*

Note:

*Indicate prior ASDs have been prepared to address confirmed SSIs.

4.0 ALTERNATE SOURCE DEMONSTRATION

In accordance with Rule § 391-3-4-.10 and 40 CFR § 257.90(e), the following discussion provides a demonstration that the SSIs identified following the February and May 2024 sampling events are not the result of a release from Cell 1 or the PAC Ash Cell. All but two SSIs identified after the February and May 2024 sampling have been the subject of prior ASDs, as summarized on Table 1, and the findings of those ASDs have been summarized in this demonstration, particularly in sections 4.2 and 4.3.

In general, SSIs can be attributed to natural variability in groundwater chemistry. The variations in metal concentrations at several wells across the Site reflect variations in groundwater flow and chemistry following repairs to the sedimentation ponds and the clear pool made in 2023 and on other occasions in previous years that have affected nearby monitoring wells.

4.1 Barium, Calcium, Chloride, Sulfate, and TDS at GWC-4

4.1.1 Natural Occurrence of Barium in Regional and Site Groundwater

The concentration of barium in groundwater at GWC-4 during the February 2024 monitoring event (0.10 mg/L or 100 µg/L) is above the intrawell prediction limit (0.053 mg/L or 53.18 µg/L), but substantially below the MCL of 2 mg/L (Figure 5). Barium is a naturally occurring alkaline earth metal commonly found in soils at a range of 10 to 5,000 mg/kg in soils across the United States, with an average concentration of 290 mg/kg in the Eastern United States (Smith and Huyck, 1999). Barium is typically found in groundwater as the divalent cation Ba²⁺ across a wide range of redox and pH conditions. As such, barium is prevalent in Piedmont groundwater at concentrations typically higher than other metals (USGS 2013). Where barium concentrations are high in groundwater, it has been observed that there is low sulfate in groundwater, indicating barite [BaSO₄], a common mineral, is a likely control on the barium concentration in natural groundwater (Hem 1985). With a range of less than 50 parts per billion over the upper PL, such variations in barium and other metal concentrations in groundwater are expected due to natural variations in groundwater quality resulting from variations in groundwater flow.

Barium concentrations at well GWC-4 are comparable to the reported range of barium concentrations (0.02 to 0.12 mg/L) in the crystalline rock aquifers of the Piedmont (USGS 2009 and USGS 2013). Barium in site groundwater is most likely derived by barite, which is a naturally occurring mineral. Barite is common in the Piedmont region and has been historically mined in some areas of the Piedmont (Cook, 1978). Because barite is easily dissolved under most geochemical conditions (USGS 2013), the occurrence of barium at varying concentrations can occur at the Site due to variability of groundwater levels and the subsequent saturation of barium due to increased amounts of barium dissolved into groundwater. Figure 4 shows a notable decline in groundwater levels, in several site monitoring wells since 2020 (Figure 4). This decline in groundwater level at the Site coincided with the repair of above-ground pipes and installation of a new liner in the North Sedimentation Pond (Figure 1). Time series concentration trend of barium closely resembles the trends for calcium, sulfate, and TDS, indicating a common mechanism of the release of these constituents to groundwater. This is further described in section 4.1.4.

4.1.2 Natural Variability of Calcium, Sulfate, Chloride, and TDS

The calcium concentration at GWC-4 in February 2024 was 31 mg/L, compared to the intrawell PL of 17.6 mg/L (Figure 5). Similar to barium, the calcium concentration in well GWC-4 most likely reflects a decrease in groundwater elevation in GWC-4 due to the repairs and installation of a new liner in the nearby North Sedimentation Pond. Decreased groundwater levels resulted in increased mineral solubility of calcium and

barium. This is reflected in the saturation indices shown by a geochemical model that describes the site conditions based on recently collected ion data. The saturation indices (SI) for barite and gypsum have increased at GWC-4 since the previous event (fall 2023) from 0.2111 to 0.5682 and from -2.1855 to -1.9297, respectively.

The sulfate concentration at GWC-4 in February 2024 was 84 mg/L, compared to the intrawell PL of 6.288 mg/L (Figure 6). The chloride concentration at GWC-4 in February 2024 was 21 mg/L, it was then resampled in May 2024 and the concentration was 28 mg/L, compared to the intrawell PL of 16.42 mg/L (Figure 7). The chloride concentration is relatively low for natural groundwater. The TDS concentration at GWC-4 in February 2024 was 260 mg/L, compared to the intrawell PL of 178.1 mg/L (Figure 6). Since TDS is essentially a sum of dissolved major and trace elements in groundwater, TDS is simply a reflection of slightly elevated calcium, sulfate, and chloride concentrations due to natural variations in groundwater quality, and mineral saturation and solubility. Any release of gypsum leachate from the lined CCR landfill units would show notably higher concentrations of TDS and other constituents leached from CCR. This is clearly not evident in the concentration trends for barium, calcium, chloride, and TDS in well GWC-4.

4.1.3 Lack of Boron in Well GWC-4

Boron is a constituent in CCR materials that is commonly used as an indicator parameter in groundwater monitoring at CCR units because of its behavior as a conservative (non-reactive) element in groundwater quality (Ruhl, 2014). Boron has not been detected historically at GWC-4 (i.e., <0.022 mg/L, Figure 7), which is an additional line of evidence indicating that the detected SSIs are not the result of a release from the lined CCR landfill units.

4.1.4 Mineral Saturation in Well GWC-4

Mineral saturation indices (SIs)¹ for well GWC-4 are shown in Table 2. The SIs indicate that calcite (CaCO₃) and gypsum (CaSO₄) are undersaturated and barite (BaSO₄) is near equilibrium for the chemical composition of groundwater in well GWC-4. This means additional calcium and sulfate dissolution from the aquifer system remains favorable until chemical equilibrium (calcium, barium, and/or sulfate saturation) is achieved. The apparent increase in TDS concentrations above the PLs is attributable to mineral dissolution and re-equilibration, and such variations in metal concentrations are expected due to natural variations in groundwater quality in the overburden-fractured rock aquifer at the Site. Physical changes at the Site from engineering and construction activities can also cause these changes when soils rich in calcium and sulfide minerals are exposed to the surface with additional recharge. Additionally, excavation of vegetation and organic soils found in the sediment pond footprint (previously used for stormwater control), the addition of structural fill, and construction of a two-foot layer of compacted clay liner provide a site-specific, non-CCR source of soluble minerals. Overall, the groundwater quality in well GWC-4 reflects metal concentrations that are comparable to reported background concentrations in the nearby Piedmont areas (USGS 2013).

Groundwater elevations in well GWC-4 have declined since 2020 (Figure 4). The changes in groundwater levels affect the pH and redox condition in the uppermost aquifer and subsequently affect the kinetics of mineral

¹ Mineral Saturation Index (SI) is a measure of whether a water will tend to dissolve or precipitate a particular mineral. An SI is negative when the mineral may be dissolved (i.e., it is present below its saturation concentration), positive when it may be precipitated (i.e., is above its saturation concentration), and zero when the water and mineral are at chemical equilibrium. The SI is calculated by comparing the chemical activities of the dissolved ions of the mineral (ion activity product, IAP) with their solubility product (K_{sp}). In equation form, $SI = \log(IAP/K_{sp})$.

dissolution or precipitation. Groundwater elevations at several of the Site wells (including GWC-4) have declined nearly five feet since 2019, likely due to the 2020 construction of the lined sedimentation pond.

Based on these facts, the elevated concentrations of barium, calcium, chloride, sulfate, and TDS at GWC-4 are not the result of a release from Cell 1 but rather due to natural variability in groundwater chemistry due to the change in recharge conditions and cation exchange reactions.

4.2 Calcium at GWC-7, GWC-8A, GWC-19, and GWC-20

An ASD for calcium at GWC-8A, GWC-19 and GWC-20 was last submitted on April 28, 2024. Calcium concentrations in February 2024 at monitoring wells GWC-7, GWC-19 and GWC-20 were 17 mg/L, 19 mg/L, and 17 mg/L, respectively. GWC-7 was resampled for calcium in May 2024, confirming the original results. These concentrations are within close range to their corresponding intrawell prediction limits (16 mg/L, 15.99 mg/L, and 15.76 mg/L, respectively). As indicated, the concentrations are only slightly elevated in comparison to their PLs. This slight variance from the PLs is indicative of site-wide changes in chemistry likely due to changes in water level or site construction. At well GWC-8A, the calcium concentration in February 2024 was 49 mg/L (Figure 8) and was within less than 4 mg/L of its intrawell PL of 45.47 mg/L. The variations in calcium in groundwater at GWC-8A (which does not exhibit any other SSIs), are due to natural variations in groundwater quality related to mineral saturation and solubility.

General chemistry of wells showing SSIs for calcium are compared to upgradient groundwater monitoring wells on a piper trilinear diagram presented as Figure 9. Review of the piper diagram shows that the constituent concentrations in wells GWC-7, GWC-8A, GWC-19 and GWC-20 are similar to upgradient groundwater quality and do not indicate influence from Cell 1 or potentially PAC Ash Cell. Overall, the groundwater quality in wells GWC-7, GWC-8A, GWC-19, and GWC-20 reflects metal concentrations that are less than an order of magnitude of their respective intrawell/interwell PLs and are comparable to reported background concentrations in site background wells and in the nearby Piedmont areas (USGS 2013).

SIs for wells GWC-7, GWC-8A, GWC-19, and GWC-20 are shown in Table 2. The SI data indicate that calcite (CaCO_3) is undersaturated based on the chemical composition of groundwater in wells GWC-7, GWC-8A, GWC-19, and GWC-20. This condition means additional calcium dissolution from the aquifer system remains favorable until chemical equilibrium (calcium saturation) is achieved. The apparent increase in calcium concentrations above the PLs is attributed to mineral dissolution and re-equilibration, and such variations in metal concentrations are expected due to natural variations in groundwater quality in the overburden-fractured rock aquifer at the Site. Physical changes at the Site from engineering and construction activities can also cause these changes when soils rich in calcium and sulfide minerals are exposed to the surface with additional recharge. Additionally, excavation of vegetation and organic soils found in the sediment pond footprint (previously used for stormwater control), the addition of structural fill, and construction of a two-foot layer of compacted clay liner near GWC-19 and GWC-20, coupled with liner repairs and site maintenance at the lined pond near GWC-8A can provide a site-specific, non-CCR source of soluble minerals.

Groundwater elevations in wells GWC-19 and GWC-20 have slightly declined since March 2019 (Figure 4), since the over-excavation and lining of the North Sedimentation Pond. Construction, including the addition of 2,600 feet of underdrain, occurred at the Site. Construction of the drain, which occurred in December 2019, (Brantley 2020), corresponds to the observed increase in calcium GWC-19 and GWC-20. An inverse relationship observed between calcium and sulfate since 2018 (Figure 8) further substantiates that groundwater in well GWC-8A does

not reflect gypsum solubility but rather a groundwater signature that reflects variability in calcium concentrations due to variations in site groundwater conditions.

The decreases in groundwater levels can affect the pH and redox condition in the uppermost aquifer and subsequently, affect the kinetics of mineral dissolution or precipitation. Groundwater elevations have declined nearly five feet in several of the Site wells (including GWC-19, and GWC-20) since 2019 (Figure 4).

4.3 Sulfate at GWC-6 and GWC-10

An ASD for sulfate at GWC-10 was last submitted on November 29, 2023. SSIs of sulfate have been identified at GWC-6 and GWC-10 following the February 2024 sampling event and were confirmed during the May 2024 resampling event. Although the May 2024 resample results confirmed the concentrations reported in February 2024, sulfate concentrations in May 2024 decreased from the February 2024 results. The May 2024 concentration of sulfate at GWC-6 is 18 mg/L, which is only slightly above the intrawell PL (17.05 mg/L). The May 2024 concentration of sulfate at GWC-10 is 3.9 mg/L which is only slightly above the intrawell PL of 1.2 mg/L. General chemistry at GWC-6 and GWC-10 compared to upgradient groundwater monitoring wells is presented on a piper trilinear diagram (Figure 9). Review of the piper diagram shows that GWC-6 and GWC-10 concentrations are similar to upgradient groundwater quality and do not suggest influence from another source (i.e., Cell 1).

A primary indicator parameter, boron, has not been detected at GWC-6 above the quantitation reporting limit (RL). It has also been consistently not detected at GWC-10, with the exception of low concentrations detected in August and December 2022. Chloride concentrations in these wells over the last three years have been low (below 7.6 mg/L) and no trends are noted for GWC-6 and GWC-10 (Figure 10). If the SSIs of sulfate reported in wells GWC-6 and GWC-10 were due to a release from the landfill, an increase in multiple indicator parameters would be expected, notably boron and chloride, which has not been observed. As a result, the increases in sulfate concentration at GWC-6 and GWC-10 are attributed to natural variations in groundwater chemistry.

Calculated mineral SIs for wells GWC-6 and GWC-10 are shown in Table 2. The SI data indicate that gypsum (calcium sulfate) and barite (barium sulfate) are undersaturated, based on the chemical composition of groundwater in wells GWC-6 and GWC-10. This means that calcium, barium, and sulfate are favored for dissolution in the aquifer system until mineral equilibrium (SI = zero) for these constituents is achieved. If there was a release from Cell 1, the expectation would be that groundwater quality would be significantly affected by the major indicator parameters (boron and chloride particularly) and that the groundwater would be saturated with sulfate and barium (i.e., the saturation indices for these constituents would be notably greater than zero).

5.0 CONCLUSIONS

This ASD has been prepared in response to apparent statistical exceedances presented in the *2024 Semi-Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Plant Scherer Cell 1 and PAC Ash Cell, Permit No. 102-009D(CCR)*, dated August 30, 2024. In accordance with 40 CFR § 257.90(e) and §391-3-4-.10 of the Georgia Solid Waste Management Rules, this ASD addresses each of the SSIs noted following the February 2024 sampling and the May 2024 resampling events.

Based on the data presented herein, SSIs from the February and May 2024 monitoring/resampling events are not the result of a release of constituents from the lined landfill units, but rather natural variability in groundwater quality. The lines of evidence include:

- The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system. There is no evidence of a release through the liner systems.
- Construction and repair of the lining of the North Sedimentation Pond has affected localized aquifer recharge and groundwater elevations in nearby wells.
- The reported concentrations of barium are within the range of concentrations expected in the overburden – fractured bedrock aquifers in samples from the Piedmont in the southeastern United States (USGS 2009; USGS 2013).
- The chemical composition of groundwater in wells GWC-6, GWC-7, GWC-8A, GWC-10, GWC-19, and GWC-20, are similar to upgradient groundwater (Figure 9).
- Boron, a primary indicator parameter for CCR, does not exhibit an SSI at wells GWC-4, GWC-6, GWC-7, GWC-8A, GWC-10, GWC-19, and GWC-20
- Mineral saturation indices suggest that barium, chloride, sulfate, and hence, overall TDS concentrations in groundwater in GWC-4, GWC-6, GWC-7, GWC-8A, GWC-10, GWC-19, and GWC-20 are affected by the natural mineral dissolution in the aquifer materials rather than a release from Cell 1.

The SSIs addressed above are below their MCLs and occur at low concentrations commonly noted in groundwater unaffected by CCR units. Based on the findings presented herein, Georgia Power will continue with detection groundwater monitoring at Cell 1 and PAC Ash Cell. A copy of this ASD will be included with the forthcoming Annual report.

SUMMARY OF STATISTICALLY SIGNIFICANT INCREASES
2024 FIRST SEMI-ANNUAL EVENT
 Georgia Power Company - Plant Scherer
 Monroe County, Georgia

Constituent	Units	Well ID	Intrawell Prediction Limit	Interwell Prediction Limit	Concentration (mg/L)		ASD Previously Submitted
					February-March 2024	May 2024	
CELL 1							
Barium	mg/L	GWC-4	0.05318	0.051	0.10	NA	Yes ^[1]
Calcium	mg/L	GWC-4	17.6	15	31	NA	Yes ^[1]
Calcium	mg/L	GWC-7	16	15	17	17	No
Calcium	mg/L	GWC-8A	45.47	15	49	NA	Yes ^[1]
Calcium	mg/L	GWC-19	15.99	15	19	NA	Yes ^[1]
Calcium	mg/L	GWC-20	15.76	15	17	NA	Yes ^[1]
Chloride	mg/L	GWC-4	16.42	7.2	21	28	Yes ^[3]
Sulfate	mg/L	GWC-4	6.288	3.5	84	NA	Yes ^[1]
Sulfate	mg/L	GWC-6	17.05	3.5	25	18	No
Sulfate	mg/L	GWC-10	1.2	3.5	4.7	3.9	Yes ^[2]
Total Dissolved Solids	mg/L	GWC-4	178.1	137.2	260	NA	Yes ^[1]

Notes:

[1] Alternate Source Demonstration Georgia Power Company – Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102.009D(LI) 2023 Second Semi-Annual Monitoring Event, April 28, 2024 (WSP, 2024).

[2] Alternate Source Demonstration Georgia Power Company – Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102.009D(LI) 2023 First Semi-Annual Monitoring Event, November 29, 2023 (WSP, 2023).

[3] Alternate Source Demonstration Georgia Power Company – Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102.009D(LI) Second Semi-Annual 2018 Monitoring Event , April 26, 2019 (Golder, 2019).

mg/L - milligrams per liter

NA - Not Analyzed

TABLE 2
SATURATION INDICES - 2024 FIRST SEMI-ANNUAL EVENT

Georgia Power Company - Plant Scherer
Monroe County, Georgia

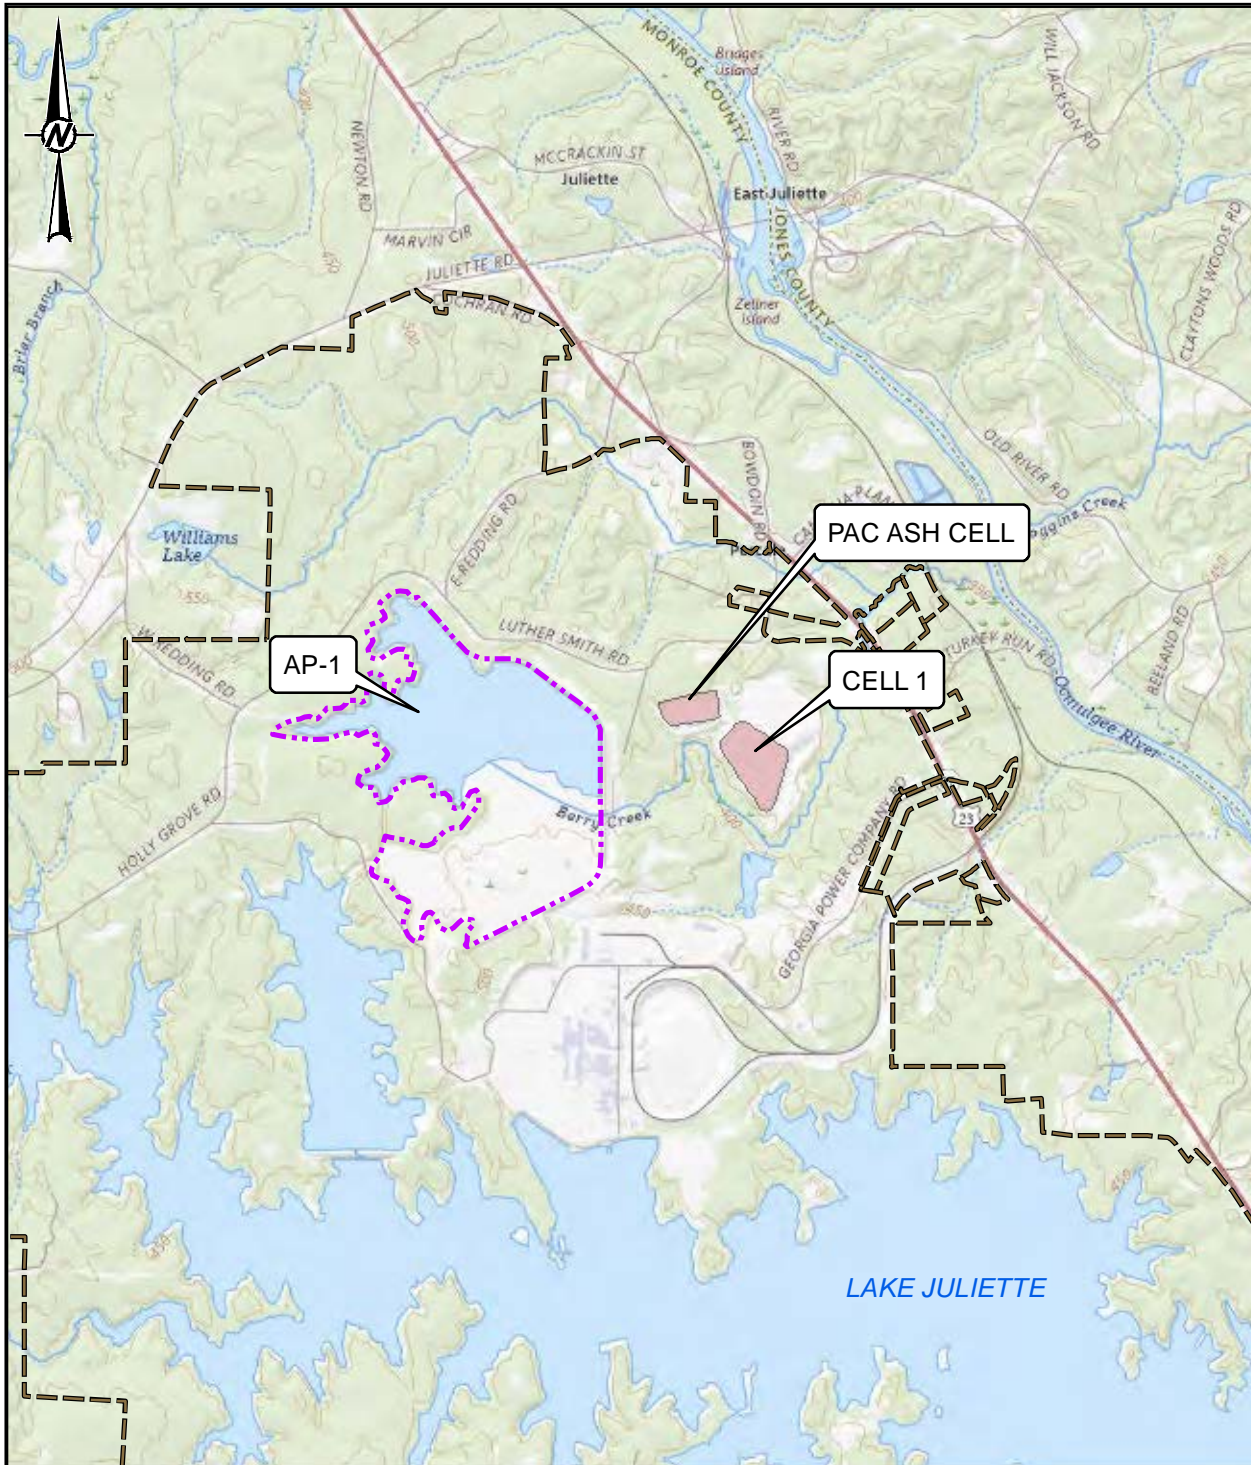

Well ID	February/May 2024		
	Calcite	Barite	Gypsum
GWA-15	-3.9302	-1.7169	-4.0836
GWA-16	-1.8156	-2.2067	-4.4121
GWA-17	-2.1849	-2.1472	-4.5996
GWC-1	-1.4592	-1.6735	-4.0699
GWC-2	-1.6843	-1.5061	-3.884
GWC-3	-2.6473	-0.9548	-3.2143
GWC-4	-1.8869	0.5682	-1.9297
GWC-5	-1.8617	0.1273	-1.9798
GWC-6	-1.8295	-0.1283	-2.553
GWC-7	-1.6742	-1.4818	-3.8059
GWC-8A	-0.8945	-0.5726	-2.4432
GWC-9	-1.3876	-0.5986	-2.7067
GWC-10	-1.6748	-1.0198	-3.259
GWC-11	-2.1141	-2.2423	-4.345
GWC-12	-4.8329	-2.1385	-5.2113
GWC-13	-2.8669	-1.5273	-4.1865
GWC-14	-3.3762	-2.3802	-4.5488
GWC-18	-1.9981	-1.4074	-3.8755
GWC-19	-1.7949	-2.076	-4.2516
GWC-20	-1.5233	-1.8429	-4.1421

Note:

Mineral Saturation Index (SI) is a measure of whether a water will tend to dissolve or precipitate a particular mineral. An SI is negative when the mineral may be dissolved (i.e., it is present below its saturation concentration), positive when it may be precipitated (i.e., is above its saturation concentration), and zero when the water and mineral are at chemical equilibrium. The SI is calculated by comparing the chemical activities of the dissolved ions of the mineral (ion activity product, IAP) with their solubility product (K_{sp}). In equation form, $SI = \log(IAP/K_{sp})$
